

Queue-Haul

Proportional
fairness
allocator

```
graph LR; A[Proportional fairness allocator] --> B[Minimize peak resource pressure]; B --> C[Minimize worst congestion cost]; C --> D[Minimize variance between classes];
```

The diagram illustrates the Queue-Haul architecture as a sequence of four components. It begins with a 'Proportional fairness allocator' box, followed by an arrow pointing to a 'Minimize peak resource pressure' box. This is followed by another arrow pointing to a 'Minimize worst congestion cost' box, and finally an arrow pointing to a 'Minimize variance between classes' box. All boxes are white with black outlines and text, set against a dark teal background.

Minimize
peak
resource
pressure

Minimize
worst
